

Our external roller blind range is an ideal solution for those seeking a modern and alternative shading system. Available with wire guides or side channels and with the options of either custom made pelmets or exposed stainless steel componentry.

All fabrics used are of the highest quality and are designed to withstand our climate and weather conditions.

These systems are capable of being controlled manually or with motorisation and can be incorporated into CBUS and Building Management Systems.

Utilising sun and wind sensors means optimal operating parameters can be achieved automatically.

Solar and Insulating Properties:

As with any blind these specifications are determined by the fabrics used in manufacture. As clients are becoming more aware and concerned with the impact they are having on the environment they are beginning to understand the benefits of External Shading Solutions.

This is proving to be particularly evident in matters concerning carbon and greenhouse gas emissions. These type of systems are more effective than conventional internal blinds in that they act to reduce not only solar glare and transmission but they also contribute markedly to the reduction of heat gain through glass. These factors are becoming very important as we strive to become a more sustainable society.
